Health Data Max LLC

Hiring Team

Re: Clinical Business Analyst Intern

Dear Health Data Max Hiring Team,

I am applying for the Clinical Business Analyst Intern position because it connects three parts of my background that I want to keep building together: healthcare data, applied AI, and the careful translation of operational needs into reliable technical work. I am currently completing an M.S. in Data Science at Rochester Institute of Technology and an M.S. in Teaching Computer Science K–12 at the University of Rochester, both expected in December 2026.

At VEDADATA, I designed Python and pandas workflows for ingestion, preprocessing, validation, and analytics-ready delivery. I also collaborated across technical and nontechnical teams to clarify requirements, review outputs, document findings, and improve reliability and usability. At VIOME, I developed healthcare-oriented machine-learning workflows involving preprocessing, feature engineering, model experimentation, and evaluation in AWS environments. These roles taught me to treat data quality, traceability, and clear documentation as core product requirements rather than cleanup work.

My graduate work adds a research and testing perspective. I have completed healthcare analytics work on hospital-readmission prediction, computational biology projects involving RNA-focused data, and fairness-aware evaluation for high-stakes decision systems. In my current graduate assistantship, I build reproducible Python evaluation workflows with automated validation, structured logging, shared datasets, and comparison-ready reporting. I regularly turn complex requirements and results into technical reports, presentations, and artifacts that faculty and collaborators can inspect and reuse.

I would bring Health Data Max strong analytical and documentation skills, experience identifying inconsistent or unexpected data, and the ability to communicate clearly across engineering, data, research, and nontechnical contexts. I am especially interested in learning the clinical code sets, interoperability standards, and risk-adjustment workflows used by your platform while contributing immediately to requirements documentation, data validation, test scenarios, defect reporting, dashboards, and implementation materials.

Thank you for considering my application. I would welcome the opportunity to discuss how my healthcare AI, data-quality, and cross-functional communication experience can support Health Data Max's Clinical AI platform.

Sincerely,

Piter Z. Garcia Bautista
