Dear Cardiff Hiring Team,

I am applying for the Python Engineer, Financial Data Platform & Integrations role. My experience building Python data pipelines and AWS-based workflows, combined with graduate research in reproducible systems and model evaluation, aligns with your emphasis on reliable data before downstream automation.

At VEDADATA, I designed data ingestion, cleaning, preprocessing, and validation workflows and built AWS quality checks to improve the traceability and usability of production data. At VIOME, I developed Python machine-learning workflows for healthcare applications, including data preparation, feature engineering, and evaluation. My current research at RIT extends that discipline through automated validation, structured logging, and comparison-ready experiments.

What interests me most about Cardiff is the responsibility for making provider data trustworthy enough to support real decisions. I would bring a practical approach: understand the business process and source data, establish a baseline, build one integration at a time, test failure cases, and measure reliability before expanding. I see AI as one tool in that process, not a substitute for sound data engineering or human judgment.

My strongest demonstrated experience is in Python, SQL, pandas, AWS workflows, and validation. I would welcome a discussion of how those skills transfer to your financial-provider integrations and the platform-specific experience you need. I am based in Rochester, New York, and interested in the remote contract opportunity.

Thank you for considering my application. I would appreciate the opportunity to discuss my work and how I could contribute to Cardiff's data platform.

Best regards,
Piter Garcia
