HMH / NWEA

Hiring Team

Re: Senior Data Analyst, Requisition 20774

Dear HMH and NWEA Hiring Team,

I am applying for the Senior Data Analyst position because it brings together two parts of my work that I care about deeply: building reliable, reproducible data workflows and helping educators make better-informed decisions for students. I am completing M.S. degrees in Data Science at Rochester Institute of Technology and Teaching Computer Science K–12 at the University of Rochester in December 2026. I previously earned an M.S. in Computer Science and bring more than ten years of experience across software, data systems, and applied analytics.

At VEDADATA, I designed SQL, Python, and pandas workflows for data ingestion, cleaning, transformation, validation, and analytics-ready delivery. I built quality checks to identify missing, inconsistent, and unusual information and worked with technical and nontechnical colleagues to clarify requirements, document findings, and improve reliability. At VIOME, I developed healthcare-oriented machine-learning workflows involving preprocessing, feature engineering, model experimentation, evaluation, and AWS-based data preparation. These roles taught me to treat data quality, provenance, and clear documentation as core parts of analysis rather than afterthoughts.

My current RIT graduate assistantship adds a rigorous research dimension. I build reproducible Python evaluation workflows for adaptive decision systems, using structured logging, shared datasets, automated validation, and comparison-ready reporting. I translate research questions and experimental requirements into data structures, analyses, visualizations, and technical artifacts that collaborators can inspect and reuse. This work closely matches the position's emphasis on transparent pipelines, quality assurance, troubleshooting, and partnership with researchers.

My University of Rochester teaching preparation gives me an additional lens on the downstream use of education data. In K–5 computer science and community science settings, I have used formative checks and student participation evidence to adjust grouping, pacing, directions, and supports. That experience reinforces why assessment and product data must be accurate, clearly defined, and communicated with appropriate limitations when it informs decisions about learners and instruction.

I would welcome the opportunity to support NWEA's Research and Policy Partnerships team by making complex datasets more accessible, reliable, and reusable. I would bring strong SQL and Python skills, a consistent focus on data integrity and reproducibility, and the ability to communicate across research, technical, and education contexts.

Thank you for considering my application. I would be glad to discuss how my data-workflow, research, and teaching experience can contribute to HMH and NWEA.

Sincerely,

Piter Z. Garcia Bautista
